Patrick,

College Station Utilities has been on the leading edge using composites since the mid 1990's. We realize the distinct advantages that composites provide, especially when it comes to utility poles. Composite poles are lighter in weight, easier for field modifications, and safer for my crews due to their extremely low conductivity.

In 2006, we bought our first RStandard poles and installed in both low voltage Distribution and high voltage Transmission applications. In the applications of RStandard poles to date, we have been more than satisfied with their performance.

We are watching the performance of our RStandard poles closely as our goal is to one day use only composite, steel, and concrete poles. To date we are very pleased, and I look forward to continuing to work with RS Technologies in the future!
